"Let us be alert to the season in which we are living. It is the season of the Blessed Hope, calling for us to cut our ties with the world and build ourselves on this One who will soon appear. He is our hope—a Blessed Hope enabling us to rise above our times and fix our gaze upon Him." Tozer

Israeli official says 'decisive moments' on Iran closer after IAEA shuts nuclear probes

The recent report by IAEA showing increased enrichment alongside statements saying Iran has provided answers on two probes surrounding undeclared activity have had Israeli decision-makers on edge.

Prime Minister Benjamin Netanyahu presents suspicious nuclear activity in Iran | File photo: Oren Ben Hakoon

The renewed momentum toward a nuclear deal with Iran alongside new information on the scope of its enrichment and the decision by the international atomic watchdog to shut two outstanding investigations have had Israeli decision-makers on edge.

An Israeli diplomatic official told *Israel Hayom* that Israel was "moving closer to the decisive moments in the face of the nuclear threat posed by Iran; we will not let Iran have a nuclear weapon." The source made this comment after Prime Minister Benjamin Netanyahu reacted to the International Atomic Energy Agency report on the status of Tehran's nuclear program and the state of the investigations: "I have a clear message to Iran and the international community: Israel will do everything it needs to do in order to deny Iran a nuclear weapon."

Earlier on Thursday the Israeli Foreign Ministry slammed the IAEA for its decision to end the probe into two cases of undeclared nuclear activity, which have been a sticking point between Iran and the West on reviving the 2015 nuclear deal.

"The closure of the Marivan Iranian safeguard case by the International Atomic Energy Agency is a matter of great concern. The explanations provided by Iran for the presence of nuclear material at the site are not reliable or technically possible. Iran continues to lie to the IAEA and deceive the international community," Spokesperson Lior Haiat said on Twitter.

He continued: "The yielding of the Director General of the IAEA and the International Atomic Energy Agency to Iranian political pressure is very disappointing, mainly because the information in the file implicitly points to two faces of blatant Iranian violations of the inspection agreements. Closing the case could have extremely dangerous consequences, and it conveys a message to the Iranians that they are not required to pay a price for their violations and that they can continue to deceive the international community on their way to achieving a full military nuclear program. In addition, closing the case in this manner severely damages the professional credibility of the IAEA.

The two confidential quarterly reports by the Vienna-based IAEA, distributed to member states of the organization, said inspectors no longer had questions on uranium particles found to be enriched to 83.7% at its underground Fordo facility. That had sparked tensions over the last several months as uranium enriched to 90% is weapons-grade material. Iran had argued those particles were a byproduct of its current enrichment as particles can reach higher enrichment levels in fluctuations.

"The agency informed Iran that, following its evaluation of the data, the agency had assessed that the information provided was not inconsistent with Iran's explanation ... and that the agency had no further questions on this matter at this stage," the reports said.

The report said investigators also have closed off their investigation of traces of man-made uranium found at Marivan, near the city of Abadeh, some 525 kilometers (325 miles) southeast of Tehran.

Analysts had repeatedly linked Marivan to Iran's secret military nuclear program and accused Iran of conducting high-explosives tests there in the early 2000s. The IAEA reports seen Wednesday also referenced that "Iran conducted explosive experiments with protective shielding in preparation for the use of neutron detectors and nuclear material" at the site.

The report said that "another member state" operated a mine in the area in the 1960s and 1970s under the rule of then-Shah Mohammad Reza Pahlavi. It wasn't immediately clear which nation was involved in the mining.

Globalists revving up plans to engineer global famine and starvation: 13 nations agree to convert over to less-productive 'green' farming methods

The global climate cult is getting ready to kick its war on food into overdrive with 13 nations – many of them major cattle and food-producing states led by the United States, Argentina, Brazil, Chile and Spain – signing onto a commitment to place farmers under new restrictions intended to reduce emissions of methane gas.

The Global Methane Hub announced in a May 17 press release that agriculture and environmental ministers and ambassadors from 13 countries, including the United States, have signed a commitment that pledges to reduce methane emissions in agriculture. The U.S. was represented by Biden's climate czar, John Kerry.

What does this mean and why should you care? We'll break it down.

According to the press release issued by these nations and posted at **Global Methane Hub**:

“Last month (in April 2023), the Global Methane Hub collaborated with the Ministries of Agriculture of Chile and Spain to convene the first-ever global ministerial on agricultural practices to reduce methane emissions. The ministerial brought together high-ranking government members to share global perspectives on methane reduction and low-emission food systems. The gathering led to a statement in which the nations committed to support efforts to improve the quality and quantity of, and access to, finance for climate change adaptation and mitigation measures in the agriculture and food sectors and to collaborate on efforts aimed at lowering methane emissions in agriculture and food systems.”

Conference participants included the Food and Agriculture Organization of the United Nations, Climate & Clean Air Coalition, Inter-American Institute for Cooperation on Agriculture, the World Bank, the Organization for Economic Co-operation and Development, and the Inter-American Development Bank.

The World Bank, another creation of the post-World War II, U.S.-led liberal rules-based order, has been talking a lot lately, along with the U.N., about a coming famine. The World Bank issued a white paper just last week, on May 22, titled ***Food Security Update: World Bank Response to Rising Food Insecurity***.

The director of the United Nations World Food Program has also been putting out, starting in September of last year, **dire warnings about a coming global famine**.

So it's curious to me that, at the very time the globalists are warning about food shortages and famine, their mouthpieces at the World Bank, the U.N., and within the administrations of the U.S. and its allies (notice China and Russia are nowhere to be found in these preposterous anti-food policies), are talking about converting over to a new and unproven form of “sustainable” farming that's focused more on reducing methane than it is on producing the highest yields of food.

Modern food production is bad, they tell us, because it produces methane which supposedly harms the environment.

“Food systems are responsible for 60% of methane emissions,” said Marcelo Mena, CEO of Global Methane Hub. “We congratulate countries willing to take the lead in food systems methane mitigation and confirm our commitment to support this type of initiative with programs that explore promising methane mitigation technologies and the underpinning research of methane mitigation mechanisms to create new technologies.”

John Kerry is also very excited about taking valuable, productive farmland offline, reducing the size of cattle herds, and turning our food-production systems over to technocrats and globalists offering vague promises of “new technologies.”

According to the U.S. Environmental Protection Agency, the U.S. is busy trying to mitigate methane emissions not just in America but worldwide, stating on its **website**: “The United States provides key leadership, funding and technical expertise for international methane emission reduction efforts, resulting in more than 1,140 methane mitigation projects through GMI as of 2021.” See *map of EPA methane mitigation activity below*:

In just one example, the Biden administration plans to spend \$1.5 million in taxpayer funds on a program aimed at “empowering” female climate change activists in the “patriarchal” society of northern Kenya, documents reviewed by the **Washington Free Beacon** show.

John Kerry said in a statement, “Mitigating methane is the fastest way to reduce warming in the short term. Food and agriculture can contribute to a low-methane future by improving farmer productivity and resilience. We welcome agriculture ministers participating in the implementation of the Global Methane Pledge.”

The May 17 press release further states that, “The focus of the conference was the deployment of science-based practices, innovation, and technologies in line with sustainable food production...”

The nations signing onto this pledge to transform their farm policies are the United States, Argentina, Australia, Brazil, Burkina Faso, Chile, Czech Republic, Ecuador, Germany, Panama, Peru and Spain.

The government of Spain will organize a second conference in 2024 to monitor and advance implementation efforts related to the statement and encourage more countries to join, according to the May 14 press release.

In order to save the planet from emissions that come from cow farts, they claim it’s necessary to force farmers to change the way they farm, converting their land and livestock to more “innovative” methods and “science-based practices.” These methods will need to be implemented not just on farms but throughout the “food systems.”

They never come out and say what these “innovative” changes are, only that they will be based on “new technologies” and “science-based.”

We can presume from this language that among the practices being considered are replacing a major portion of the beef and dairy cattle, pork and chicken stocks that populations rely on for protein with insect larvae, meal worms, crickets, etc. The U.N., World Economic Forum and other NGOs have been promoting meatless diets and the consumption of insect protein for years, and billionaires have invested in massive insect factories being built in the state of Illinois, in Canada and in the Netherlands, where meal worms, crickets and other bugs will be processed as additives to be inserted into the food supply, often without clear labels that will inform people of exactly what they are eating. Bill Gates is also partnering with other billionaires to invest in the production of lab-grown meat, a process that involves using cancer cells from cows, chickens and pigs to quickly grow artificial meat.

Farmers will be increasingly forced off their land, as is already happening in the Netherlands, which is the world’s second leading net exporter of food after the United States.

All this will add up to a coming famine the likes of which has never been witnessed by the current generation of people on earth. It’s all by design. Globalists like Dennis Meadows, the author of the 1972 *Club of Rome*-endorsed book ***The Limits to Growth***, informed us of the globalists’ plans to drastically depopulate the earth. His comments in the video below were made I believe in 2017.

I’ve also reported extensively on the **Deagel forecast**, which forecasted a nearly 70 percent reduction in the population of America by 2025, with similarly drastic population declines for the U.K., Germany, Canada, Australia and other NATO-aligned countries. There is no more efficient way to depopulate than through war, famine and plagues. Isn’t it interesting that all three of these time-tested methods of murder are in play right now?

The war on food is very similar to what’s going on in the energy sector, where governments are colluding with big business to transform all transportation from gas-powered to electric-powered, meaning far fewer people will be able to afford electric cars, and even if they can afford them, the use of those cars will be much more tightly monitored and controlled due to the need for charging stations that rely on an already overtaxed power grid. If you can’t charge your car up when you want to, only when you are allowed to, you have now turned over your freedom of movement to the regulators of those charging stations.

In the food industry, Big Agriculture will also collude with the governments of the world to produce much less beef, chicken and pork, replacing that protein with insects and lab-grown fake meat, the health effects of which are largely unknown.

These changes have already been on full display in the Netherlands, where the government has generated intense controversy by launching a plan to reduce livestock herds by up to 50 percent, and reduce the use of nitrogen fertilizers by 30 percent. No matter how much they talk about “innovation” and “new technologies,” you can’t reduce your herds and reduce your use of fertilizer and then claim that your farms will be “more productive.” That’s a lie. All of their “innovations” will translate directly into less food on tables throughout the world.

Prepare now for famine. Stocking your pantry up is a short-term easy fix. We also need to be thinking long-term. If you’ve never grown a garden or raised chickens, that’s something you might want to think about in terms of increasing your skills. Maybe you’ve grown a garden for several years and have some

experience, and you can share that with a neighbor who has raised chickens but has little or no gardening experience. Networking and cooperating with the people around us will be the key to survival once this global famine intensifies.

It may be that the actual famine never arrives in the wealthiest countries like America. Food may continue to be on the shelves, but I can guarantee that prices will continue to go up, substantially, on staple items like flour, bread, eggs, meat and dairy.

Pray for the best while preparing for the worst. Because we know that the globalists' plan is to reduce the world population from 7.5 billion down to 1 or 2 billion. Dennis Meadows let the cat out of the bag and he's a globalist insider at the Club of Rome whose engagement on this topic goes back to the early 1970s.

Stay strong. Stay peaceful. Never comply. Never submit to any unconstitutional or unbiblical law. Tyrants only have power over those who agree to be governed by them. --- Leo Hohmann

Death by Injection: Top insurance researcher provides data showing staggering numbers

Using data from the United Kingdom, a top insurance industry analyst estimates 600,000 Americans per year are dying from the Covid shots

The United States has become one of the worst countries in the world when it comes to medical transparency. But one smart analyst has found an end-run around the U.S. system that places a dark shroud of secrecy over common statistics.

The U.K. has been more transparent with its data. And that's where some are going to get stats that allow them to calculate the number of excess deaths in the U.S. since the roll out of the controversial Covid jabs two and a half years ago.

Those who trusted the system and took the Covid vaccines have a 26 percent higher mortality rate on average compared to those who declined the jab – and the death toll is even more staggering for vaccinated people under 50 years old, where mortality is 49 percent higher than for those unvaccinated.

These numbers are based on government data from the U.K. and were brought to Wisconsin Senator Ron Johnson's attention by Josh Stirling, one of the nation's top insurance analysts and formerly Senior Research Analyst for U.S. nonlife insurance at Sanford C. Bernstein & Co. Listen to the clip below from his recent testimony, which of course received zero coverage in the corporate mainstream media.

Brain implants could bring great and terrible things

The FDA has approved a clinical study of a computer-brain interface in humans – technology that a bioethicist says holds huge promise and incredible danger.

The U.S. Food and Drug Administration (FDA) has given Elon Musk's tech company Neuralink permission to implant a Bluetooth-connected computer chip into human brains. Aside from

approving the trials, the FDA has not provided any details.

The approval comes as Neuralink faces federal scrutiny following employee claims that the company was rushing and botching surgeries on monkeys, pigs, and sheep last year, resulting in more animal deaths than necessary, as Musk reportedly pressured staff to receive FDA approval.

The animal experiments produced data intended to support the company's application for human trials with the ultimate hope that doctors can program the chip to help with diseases like Parkinson's and ALS, as well as hearing and vision loss or even quadriplegia.

Researcher and bioethicist David Prentice of the Charlotte Lozier Institute says the potential is breathtaking.

"Various folks ... could greatly benefit from something like this that helps coordinate the thoughts and translate those into willful muscle movement," he recognizes.

But considering that the programmers could go from doctors to psychologists or politicians, he warns that the possible threat is equally breathtaking.

"Somebody [could] hack, essentially, a brain implant to control a person's movements, even implanting certain thoughts or certain directions and motives," Prentice poses.

He points out that God has instilled in man the desire to explore, create, invent, and excel. All that, he says, is well and good as long as those explorers, creators, and inventors fear and honor God.

Since that is unlikely at best in the current culture, Prentice insists that strong safeguards are essential for this project.

"Full transparency is what is called for," he submits. "The researchers themselves, the subjects of the research – everything needs to be completely in the open so that we can guard against this turning to a poor purpose."
